Drainage tube care
Call your surgeon or go to the nearest Emergency Department if you have:18

#### How this guide works

Please bring this guide with you to all of your appointments related to your breast health. This guide should be kept up to date with all the information your health care team may need at your appointments.

Pages 2 to 10 are for your <u>health care team</u> to fill out at your appointments.

Pages 16 and 17 are for <u>you</u> to fill out at home.

What are your questions?
Please ask. We are here to help you.

## Mastectomy – General surgery contact information

# Breast reconstruction summary – Nipple/areola reconstruction

I had reconstruction of my right/left (please
circle) nipple on (year/month/day).
This reconstruction was performed under:
☐ Local anesthesia
☐ General anesthesia
This reconstruction was:
☐ Local flap-based
☐ Contralateral nipple tissue-based
☐ Full-thickness skin graft-based:
(donor site)
If bilateral:
I had reconstruction of my right/left (please circle) nipple on
(year/month/day).
This reconstruction was performed under:
☐ Local anesthesia
☐ General anesthesia
This reconstruction was:
☐ Local flap-based
☐ Contralateral nipple tissue-based
☐ Full-thickness skin graft-based:
(donor site)

Please give any additional details (such as hematoma, return to operating room) of the reconstruction below:						

## Arm movement and exercises

Can you move your arm normally? Do you have any lifting restrictions? How are the exercises going? Please make notes below:	

#### Drainage tube care

If you have an axillary node dissection/mastectomy and/or breast reconstruction, you may have 1 or 2 small drainage tubes sutured (connected by stitches) close to the incision after each procedure.

This drain will remove any fluid that collects under the incision (cut). This will help healing and lower the chances of infection. You will see fluid, blood, and clots in the drain.

#### Important points:

- Use your arm normally while the drain is in place.
- Wash your hands before and after you empty your drain.
- Always empty the container at least 3 times a day (or more often if it gets half full).
- Use the provided drain pouch or pin the drain inside your clothing to prevent the drain from being pulled out. If the drain gets pulled out, do not panic. This is not a medical emergency. Call your plastic surgeon. Cover the area with a clean dressing (gauze).

- Each day, you may notice a change in how much drainage is collected in the drain pouch. The amount of drainage should slowly become less and less.
- The colour of the drainage will change over time. It may range from bright red to dark red, or be orange/pink or yellow, and may have long, stringy clots.
- If there is no fluid in the drain, there may be a blockage. The fluid does not "dry up". Follow the steps on the next page to try to relieve the blockage and/or call your plastic surgeon.

#### How to empty the drain

- Lift the cork/plug and the drain will expand.
   Turn it upside down and empty the fluid into the measuring container.
- 2. Squeeze several times until all the fluid is out.
- 3. Squeeze the bulb until the air is out.
- 4. Close the opening with the cork/plug while still squeezing the bulb.

#### When will the drains be removed?

The drains will usually be taken out when the fluid is **less than 30 ml** each day. It is normal for the drains to stay in place for **1 to 2 weeks**.

Please record the date, time, and amount of drainage (ml) on the following pages.

## Post-mastectomy

DRAIN #1 Morning - Afternoon - Evening					
Date	Amount	Amount	Amount	Amount	Total

DRAIN #2 Morning - Afternoon - Evening						
Date	Amount	Amount	Amount	Amount	Total	

### **Post-breast reconstruction**

DRAIN #1 Morning - Afternoon - Evening						
Date	Amount	Amount	Amount	Amount	Total	

DRAIN #2 Morning - Afternoon - Evening						
Date	Amount	Amount	Amount	Amount	Total	

### Call your surgeon or go to the nearest Emergency Department if you have:

- Sudden swelling in the breast or chest wall in a short amount of time in the first 24 hours (1 day) after surgery. This could be a sign of hemotoma (blood pooling).
- Redness, swelling, or warmth around the incisions, breast, or chest area
- Fever (temperature above 38.5° C/101.3° F) and/or chills
- Pain that is not relieved by your medication
- Drainage from the incision(s) that is thick or bad-smelling
- Drain problems:
  - drainage around the tube site
  - your drain bulb will not stay flat
  - amount of drainage greatly increases or becomes bright red

#### If you have any of the above problems:

- During business hours (daytime):
  - Contact your plastic surgeon's office.
- · After hours (evening, nighttime):
  - Call 811.
  - Or go to the nearest Emergency Department.

Notes:
