

How to Hand Express Breast/Chest Milk

Yarmouth Regional Hospital

- Hand expressing is a way to take milk from your breasts/chest. It is also called manual (by hand) expressing. Hand expressing can be done when you do not have a breast pump. Your nurses will help you learn how to do this. Please tell your nurse if you have any questions or concerns.
- It is important to learn how to hand express breast/chest milk in the first hours after your baby is born. Hand expressing at least 5 times a day in the first 3 to 4 days after your baby is born, can help your milk supply. Hand expressing:
 - › helps you make milk
 - › helps your milk come in (also called milk let-down)

How to hand express breast/chest milk

When you are first learning, you can follow along with this video:

- › www.healthlinkbc.ca/pregnancy-parenting/parenting-babies-0-12-months/breastfeeding/video-hand-expressing-breastmilk

1. **Always wash your hands before hand expressing or handling your expressed milk.**
2. Place a wet, warm cloth on your breasts/chest for a few minutes before starting. This may make expressing easier.
3. Gently roll or tug on your nipple. This will help to make expressing easier. Gently massaging your breasts/chest toward the nipple can improve milk flow.
4. Move your thumb and index finger to make a C-shape just outside the dark area around your nipple (areola).
5. Push your thumb and index finger back towards your breast/chest. Gently squeeze, then release the pressure.

6. Keep this squeezing and releasing until you see drops of milk. Squeeze all the way around your areola so that you reach all of the milk ducts (where the milk is stored).

Hand expressing is a skill you can learn. It will get easier with practice. At first, you will get only a few drops — this is normal. With practice, you will learn what is normal for you.

7. When you see drops of milk, collect them in the cup you were given. Add them to the syringe when you are done. You can also collect them directly into the syringe. **Remember to put the cap on the end of the syringe** so the milk stays clean.
8. Repeat steps 1 to 7 on your other breast/side of your chest. You can hand express each breast/side of your chest for 2 to 3 minutes, 2 times a day.
9. Start a new syringe each day. Keep the milk that you express for the first time each day in the fridge. Make sure that any other milk you express that day cools to room temperature before you add it to the syringe in the fridge. At the end of each day, label the syringe with the date it was collected. You may notice you are expressing more milk each day.

If it has been 24 hours (1 day) since you collected expressed milk, move the syringe to the freezer. Never add fresh milk to frozen milk.

**What are your questions? Please ask.
We are here to help you.**

**In Nova Scotia you can call 811 to talk with
a registered nurse about your health care
questions 24/7.**
