Stool Collection for *H. pylori*, *C. difficile*, or Viral Detection

Pathology and Laboratory Medicine Halifax Area

Stool Collection for *H. pylori*, *C. difficile*, or Viral Detection

Important

- For 5 days before you collect your stool (poop), **do not use or consume** (eat or drink):
 - › Mineral oils
 - › Bismuth (Pepto-Bismol®)
 - › Barium
 - › Kaolin
- Antibiotics and/or proton pump inhibitors may affect the test for *H. pylori* if taken within 2 weeks (14 days) of stool collection.
- Talk with your health care provider about stopping these medications before collecting stool for *H. pylori*.

Instructions

- Your health care provider has given you a form for this test. This form is called a **requisition**.
- Use only the specimen bottle given to you by your health care provider, local lab, or blood collection clinic. It should be empty and have an orange top.
- If you also have to collect stool for culture and sensitivity (vial with a blue top and pink liquid inside), or ova and parasites (vial with a yellow top and clear liquid inside), **do it at the same time as this collection**.
- Use only a ballpoint pen when writing on the specimen bottle.

1. Write your **full name, your health card number, and the date and time of collection** on both the requisition **and** the specimen bottle.
2. Collect your stool in a clean, dry container. **Do not let your stool touch any urine (pee) or the toilet water.**
3. Put some of your stool into the bottle with the orange top. **Do not fill the bottle more than halfway.**
4. Screw the lid on tight and **put the bottle in the fridge** until you can take it to the lab.
5. Bring all of the filled specimen bottles and the requisition to an approved drop-off site **no more than 24 hours (1 day) after you finish collection.**
