

# Stereotactic Biopsy

## QE II Health Sciences Centre

- The nurses in the PACU will closely check your:
  - › I.V.
  - › Pulse
  - › Dressings
  - › Drainage tubes
- When you are ready, the PACU nurses will take you back to your hospital room.
- You may need to stay overnight in the hospital after this procedure.

# Stereotactic Biopsy

Your doctor has told you that you may have a **tumour** (a lump or growth of abnormal cells) or a **lesion** (damaged tissue) in your brain.

You will need a surgical procedure called a **stereotactic biopsy** to:

- › Help your doctor find out what kind of tumour or lesion you have
- › Help your doctor diagnose and/or treat your brain condition (like a movement disorder, a pain syndrome, a tumour).

## How is the procedure done?

- A **biopsy** is when a small sample of tissue is taken from your body for testing. The surgeon will take a tissue sample using a biopsy needle.
- A **pathologist** (a doctor who studies and diagnoses diseases) will look at the sample in the lab and diagnose your condition.

## What will happen during the procedure?

- The stereotactic biopsy will be done in the operating room (O.R.).
- You will have:
  - › **General anesthetic** (medication to put you to sleep during surgery)
  - or
  - › **Sedation** (medication to help you relax)
- Most biopsies are done with general anesthetic. Your surgeon will talk with you about what is right for you.

- When you are in the O.R., an **anesthesiologist** will give you general anesthetic or sedation.
- When you are asleep or sedated, the surgeon will put your head in a clamp. This will keep your head still during the procedure.
- The clamp is held in place with pins. Your surgeon may need to shave some of your hair when they put the pins in. You will have **local anesthetic** (freezing) at the pin sites so you will not feel any pain.
- The surgeon will use **MRI** (magnetic resonance imaging) and/or **CT** (computed tomography) scans of your brain and an image guided system (a computer) to find:
  - › Where to take the biopsy from
  - › The best place to make the incision (cut) in your scalp
- Your surgeon may need to shave some of your hair around the incision site.
- The surgeon will make a small hole in your skull. They will put the biopsy needle through the hole to reach the tissue. Once they have taken a sample, they will take out the needle.
- The sample will be taken to the pathologist for a diagnosis. It usually takes 7 days (1 week) to get the diagnosis.

## After your procedure

- You will be taken to the Post-Anesthesia Care Unit (PACU).
