Using Medications Safely When You Have Kidney Disease

Using Medications Safely When You Have Kidney Disease

Why is medication safety important for people with kidney disease?

- People with kidney disease often take many medications.
- These medications can help with your kidney disease and other medical conditions (like high blood pressure [hypertension] or diabetes).
- Your kidneys work to remove many medications from your body. If you have kidney disease, some medications are not removed and may build up in the body. This can be harmful.

How can I make sure my medications are OK for my level of kidney function?

- Remind each of your health care providers that you have kidney disease.
- **Do not** assume everyone knows you have kidney disease.
- When prescribed a new medication, ask if the medication is safe to take with kidney disease.
- **Do not** change pharmacies often. It is safer to use only 1 home pharmacy that has a record of your kidney disease.

What about non-prescription medications?

- Always check with your pharmacist or health care team before taking any over-the-counter medications, including herbal or natural health products, vitamins, or supplements.
- If you have kidney disease, non-prescription medications can also build up in your body. Some of these may damage your kidneys.

What will happen if a medication is not safe for my level of kidney function?

- Your pharmacist or health care provider may lower the dose (amount) of the medication, or change your prescription to a safer medication.

What do I need to know about my medications?

- It is important to know:
 - › Which medications you are taking and how to take them.
 - › What each medication is used for.
 - › What side effects to expect and what to do if you have any side effects.
 - › How to store each medication.
- Ask your health care team if you are not sure about your medications.
