

MAiD Report: January 1st to June 30th, 2018

During this period, NSHA received 94 referrals to the MAiD Service and 38 procedures were completed. The average age of those who received MAiD was 70 years, with slightly more of the number being male. Cancer was the most commonly reported diagnosis, followed by neuro-degenerative, cardiovascular and respiratory diseases.

The 56 people who did not complete the procedure either withdrew their request, lost capacity or died before receiving MAiD, or were in process at the time of the report.
