Making the Most of Your Remaining Vision

Register using a self check-in kiosk in the main entrance of the Centennial or Dickson Buildings, Victoria General site. Next, go to the Eye Care Centre in the Centennial Building, 2A.
Making the Most of Your Remaining Vision

Losing your sight can be upsetting. You may feel scared, sad, or frustrated – this is normal. It may help to talk with your family about your feelings and what they can do to help you. Don’t be afraid to reach out to others with vision loss, or to health care professionals for information and advice.

You can keep living a happy, fulfilling life. Losing your sight does not have to mean giving up activities – you can make changes and learn new ways to stay active and social.

What are the types of vision loss?

Central vision
This is the detailed vision that lets us see shapes and colours clearly. The macula (a specialized area in the back of the eye) is responsible for central vision. Damage to the macula can cause central vision loss, leaving you with only peripheral vision.

Causes of central vision loss include:
› macular degeneration
› diabetic retinopathy

Peripheral vision
This is the vision to the sides of your central vision. It is less clear than central vision, but we still see a lot through our peripheral vision. Damage to the optic nerve or vision areas in the brain can make you feel like you are seeing through a narrow tube.

Causes of peripheral vision loss include:
› glaucoma
› retinal detachment
› stroke
Contrast sensitivity
Contrast sensitivity is being able to notice small differences between light and dark. Low contrast sensitivity can affect your night vision and ability to read small letters.
Causes of low contrast sensitivity include:
› cataracts
› glaucoma
› diabetic retinopathy

How do I get used to vision loss?
Make the most of your remaining vision.
• Use the “Next Best Spot.”
  › When your central vision is blocked by a blind spot, it can help to find the “Next Best Spot.” Try to get used to using your peripheral (side) vision. This may be hard, but vision rehabilitation services can help you make the most of your remaining vision and keep you doing your daily activities.
• Make things brighter and bigger.
  › Use more lighting (e.g., carry a small flashlight, use a reading lamp).
  › Use large print (e.g., newspapers, calendars, books). Large print books are available at all public libraries.
Stay safe at home.

- Most accidents happen at home, even for those with no vision loss. It is important to follow safety practices at home, especially if you are just starting to get used to vision loss.
  - Make sure all areas of your home are well-lit.
  - Keep walkways free of clutter, including loose rugs, small furniture, and electrical cords.
  - Store things you use often in easy reach, on lower shelves or on the counter. Do not climb to reach things.
  - Talk with your occupational therapist (OT) about safety equipment for your home (e.g., stair handrails, raised toilet seats, shower grab bars).
  - Use assistive devices and safety equipment as told by your OT.
  - Keep your phone or cellphone in easy reach.
  - Review all of your medications with your doctor or pharmacist. Some drugs can make you drowsy, dizzy, or unsteady.
  - Consider wearing a medical/emergency alert system.
  - Exercise regularly to improve your muscle strength, balance, and coordination.

Try out supportive and adaptable technology.

- There are many resources for people with vision loss. These include computers, smartphones, apps, and other digital tools. Try out different tools to find out which ones work for you. They may be able to help you stay independent.
- Contact the Canadian National Institute for the Blind Foundation (CNIB) or Vision Loss Rehabilitation Canada to set up an appointment with an assistive technology specialist. They can help you set up accessible features and apps on your computer or smartphone.
Computer software

Most computers have accessibility add-ons for the display screen (e.g., larger font and cursor sizes, higher contrast, magnifying functions).

**Screen readers:** This software reads the content on the screen out loud.

- Windows Narrator is built into the Windows operating system. It reads text on the screen, as well as notifications and calendar appointments.

- JAWS® (Job Access with Speech) translates text on the screen to speech and Braille for many computer applications.
  - [www.freedomscientific.com/products/software/jaws](www.freedomscientific.com/products/software/jaws)

- For more information on screen readers, visit the American Foundation® for the Blind:
  - [www.afb.org/prodBrowseCatResults.aspx?CatID=49](www.afb.org/prodBrowseCatResults.aspx?CatID=49)

**Speech recognition:** This software changes the words you say out loud into text on the screen.

- Windows speech recognition lets you control your computer using your voice without a keyboard or mouse.

- Apple’s Dictation feature translates your spoken words into text.
  - [https://support.apple.com/en-ca/HT202584](https://support.apple.com/en-ca/HT202584)

- CDesk by AdaptiveVoice replaces your computer’s desktop with one program that includes 15 applications.

Mobile devices: Mobile devices like smartphones include many accessibility settings. Staff at mobile device stores can help you set up your phone to be more accessible.

• Apple accessibility
  › www.apple.com/ca/accessibility/iphone/vision

• Android accessibility
  › https://support.google.com/accessibility/android/answer/6006564

Siri (Apple): This lets you use voice commands to make phone calls, send messages, set alarms and reminders, get directions, play music, and more.

VoiceOver (Apple): This is a gesture-based screen reader that turns spoken words into text, recognizes images, and can describe videos.

Zoom (Apple): This built-in screen magnifier lets you make part or all of the screen look bigger.

Magnifier (Apple/Android): Use your phone’s camera as a digital magnifying glass.

Font size adjustment (Apple/Android): Make the font size on your screen bigger.

What are your questions? Please ask. We are here to help you.

In Nova Scotia you can call 811 to talk with a registered nurse about your health care questions 24/7.
Apps

**BlindSquare (Apple):** This GPS (navigation) app helps you get around both indoors and outdoors. It gives helpful information and descriptions of the environment to let you travel with confidence and safety.
   › www.blindsquare.com

**Be My Eyes (Apple/Android):** Users can connect to a live video call for on-demand visual help from volunteers around the world.
   › www.bemyeyes.com

**Aira (Apple/Android):** Users connect with trained agents through the app or through Horizon Smart Glasses. Agents can provide visual assistance, and arrange for rideshares.
   › https://aira.io

**Seeing AI (Apple):** This app uses your phone’s camera to recognize and describe text, product barcodes, people, paper money, colour, and more.
   › www.microsoft.com/en-us/seeing-ai

Home and leisure

**Smart speakers (Amazon Echo/Google Home):** Wireless speakers with voice-control functions can be connected to other devices in your home. You can then use voice commands to do things like listen to music, check the weather, make phone calls, send texts, and more.

   › https://store.google.com/ca/product/google_home
CELA (Centre for Equitable Library Access) and NNELS (National Network for Equitable Library Service): As a member of any public library in Nova Scotia, you can borrow accessible books from CELA and NNELS. The collections are designed for people with print disabilities, and include English and French materials. Items are available in audio, e-text, braille, and Print-braille picture books. Ask at your local library branch.

Keep up your social supports.
Many recreation and leisure activities can be adapted for people with vision impairment or for people who are losing their vision. It is very important for your physical health and mental wellbeing to stay active. This may mean returning to an activity you enjoy or trying something new. Staying at home to avoid asking for help is not independence and can lead to isolation and loneliness.

CNIB programs and services
CNIB offers programs for people with vision loss in 5 areas:
• daily living skills
• active and social lifestyle
• career
• education and literacy
• technology

Adjustment to Sight Loss support group: an 8-week support group led by a counsellor over the phone. You may find sharing your stories, feelings, and personal advice helpful in coping with the physical and emotional impacts of vision loss.
Vision Loss Rehabilitation Nova Scotia: offers training to help people who are blind and partially-sighted stay safe and keep their independence
› https://ns.visionlossrehab.ca/en

Blind Sports Nova Scotia: recreational and competitive sports opportunities for people of any age and skill level who are blind or visually impaired
› www.blindsportsnovascotia.ca

PatientsLikeMe®: online community for people with similar experiences. Ask practical questions about your condition, learn how others cope and manage their health, and share your personal experience.
› www.patientslikeme.com

Family and friends
Vision loss also affects your family and friends. If a loved one is going through vision loss, try to offer comfort and support. It can be hard to know what to say or do, but keeping your loved one’s independence and dignity in mind can help.

To help your relationship with someone who is visually impaired, you can start by sympathizing with their experience and asking what you can do to support them.

To learn practical tips on guiding someone with vision loss and blindness etiquette, visit:
